Patent No. 15770377
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Pickeley, Steven M.
APPLICANT: Lane, David P.
TITLE OF INVENTION: Interruption of Binding of MDM2 and P53
TITLE OF INVENTION: Protein and Therapeutic Application Thereof NUMBER OF SEQUENCES: 50
CORRESPONDENCE ADDRESS:
ADDRESSEE: Flahr, Hobbach, Test, Albritton & Herbert
STREET: Four Embarcadero Center, Suite 3400

Sequence 21, Application US/08424957
Patent No. 5770377
GENERAL INFORMATION:
Patent No. 5770377
GENERAL INFORMATION:
PICKSIPS, Steven M.
APPLICANT: Lane, David P.
TITLE OF INVENTION: Interruption of Binding of MDM2 and P53
TITLE OF INVENTION: Protein and Therapeutic Application Thereof
NUMBER OF SEQUENCES: 50
CORRESPONDENCE ADDRESS:
ADDRESSER: Flehr, Hobbach, Test, Albritton & Herbert
STREET: Four Embarcadero Center, Suite 3400
CITY: San Francisco
STATE: California
                                                                                                                                    .
.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .,

                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A_Geneseq_101002:*

Disclosure; Fig 1; 52pp; English

This sequence is a peptide homologue of a region of p53 which binds to mand. This peptide is used in the construction of a movel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells on or overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 unction. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53.

New agents which inhibit interaction of p53 and mdm2 - useful for activating p53, e.g. for treating cancers, viral conditions or other conditions associated with non functional p53 or mdm2

Disclosure, Fig 1; 52pp; English.

This sequence is a peptide homologue of a region of p53 which binds to mand. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53 where the population of cells of out overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 unction. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53.

Compounds binding to MDM2 protein and inhibit its interaction with p53 - useful in, e.g. diagnosis and treatment of cancer and viral infections and identifying binding agents

Disclosure; Page 34; 45pp; English.

This represents a p53 N-terminal peptide fragment used in an Blisa TIP assay for analysing the interaction between human oncogenic protein MDM2 can diversion provides peptide derivatives capable of binding to the human MDM2. These peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDM2. The peptides may be used to identify molecules that bind to MDM2 and to identify and design inhibitors of MDM2, p53 binding. They can also be used to purify binding partners especially MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leukaemia contexactions, especially tumours and viral infections. The peptides can interactions, especially tumours and viral infection. By interfering with MDM2/p53 interaction, the peptides can activate p53 function and cacumulation in normal cells. The peptides which mimic the MDM2 binding context in p53, have a significantly greater blocking activity compared context in the propersion of the models of the models of the models of the mid-type p53.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   a cell enters apoptosis. Apoptosis is prevented if interaction occurs. The interaction is between regions 1-71 or 290-393 of p53 and region 379-928 of Rb. The invention provides methods to identify compounds able to modulate interaction or binding between p53 and Rb protein. The method and detecting interaction/binding between them. These inhibitory compounds are used in human or veterinary medicine to modulate p53 and c11 ty and processes, specifically for inducing apoptosis in tumour cells (possibly also in cells infected by virus), in vivo or in vitro. Expression of these modulators by gene therapy methods is also contemplated. Other activities that can be affected are transcription repression, G1 arrest, DNA repair, homologous recombination and stabilise p53.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         a p53 protein and a retinoblastoma (RB) protein. This peptide corresponds to residues 11-29 of human p53 (AAW47079). The interaction between p53 and Rb is found to be critical for determining whether or not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This peptide fragment of p53 is an inhibitor of the interaction between
                                                                                                                                                                             p53/RB interaction inhibiting peptide 6 (residues 11-29 of human p53).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

It was used to raise anti-peptide p53.1 and anti-RB18A antibodies in rabbit. RB18A (see AAY06309) is a novel p53 regulatory protein of the invention. The antibodies were used in immunoscreenings that led to the isolation of a cDNA clone (see AAX59124) encoding human RB18A. The invention provides methods and compositions for the diagnostic and therapeutic applications of RB18A, in particular for the diagnosis, prevention or treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cancer; pre-cancerous state; detection; diagnosis; human p53 gene; immunodominant epitope; human cellular tumour antigen; transformation-associated protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New peptides of the invention which interfere with the binding of the p53 tumour suppressor protein and the MDM2 oncogene protein contain the peptide sequences AAR89911-3 which form part of the p53 protein binding motif between amino acids 16-33 (AAR89914). The peptides were identified by modifying the p53 consensus binding sequence by substitution of an Alanine at each pos. and identifying which amino acid changes altered binding to expressed MDM2. The peptides and methods of identifying similar inhibitory peptides can be used to diagnose and treat e.g. cancer and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New cpds. which interfere with binding of MDM2 and p53 - used to develop prods. for use in the diagnosis and treatment of cancer and other malignancies
Peptides derived from the N-terminal (amino acids 1-112) or the C-terminal (amino acids 350-393) of protein p53 which specifically acade with anti-p53 antibodies in patients with cancer or precancerous conditions are claimed. The peptides (AARS4907-RS4921) are useful for detecting and monitoring cancerous and precancerous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         73.3%; Score 77; DB 17; Length 15; 100.0%; Pred. FHA peptides may be useful for treating medical conditions associated with defects in transcriptional control, DNA replication, DNA repair, cell cycle control or other cellular process. The method may provide valuable insights into checkpoint signalling, has important implications for the functions of other FHA domain-containing proteins and provides basis for new lines of therapy. The present sequence is a peptide used in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Assays and screening methods based on direct interaction between FHA domains and phosphopeptides, useful for characterizing binding and to identify binding partners and modulators of FHA domain-phosphopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; p53; tumour suppressor; human leukocyte antigen; HLA; CTL;

the present invention describes isolated preparer 23 epicops (1). Also described are: (1) a cytotoxic T lymphocyte (CTL) that is cultured in vivo and binds to a complex of (1); (2) a peptide (II) comprising (I) and a second epitope and has less than 50 contiguous amino acids, (3) a vaccine composition comprising (II), a unit dose of a peptide with less than 50 contiguous amino acids with 100% identity to the native peptide sequence of p53, and a pharmaceutical excipient; (4) an isolated nucleic acid encoding (I); and (5) an isolated nucleic acid encoding (II) and (5) an isolated nucleic acid encoding (II). (I) has cytostatic activity and can be used in vaccines. The vaccine composition is useful for treating or preventing cancer. (I) and (II) are suseful as diagnostic agents and for evaluating immune responses. Unlike conventional epitopes, immunosuppressive epitopes that may be present in whole antigens can be avoided with the use of the vaccine truther, to modify the composition of the epitopes and turther, to modify the composition of the epitopes and immunogenicity. The possible pathological side effects caused by intrinsic biological activity, are eliminated. Add89363 to AdG89777 represent amino acid sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes isolated prepared P53 epitopes (I). Also
                                                                                                                                                                                                                                                                                                                                                                  Epitope-based vaccines comprising P53 epitope having a specified sequences, useful for treating and preventing cancer, the epitopic peptides is useful as diagnostic agents and for evaluating immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; p53; tumour suppressor; human leukocyte antigen; HLA; CTL; cytotoxic T lymphocyte; T cell; immune response; tumour; cancer; vaccine; epitope; cytostatic.

Also described are: (1) a cytotoxic T lymphocyte (CTL) that is cultured in vivo and binds to a complex of (I); (2) a peptide (II) comprising (I) and a second epitope and has less than 50 contiguous amino acids; (3) a vaccine composition comprising (II), a unit dose of a peptide with less sequence of p53, and a pharmaceutical excipient; (4) an isolated nucleic acid encoding (I); and (5) an isolated nucleic acid encoding (II). (I) has cytostatic activity and can be used in vaccines. The vaccine composition is useful for treating or preventing cancer. (I) and (II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          are useful as diagnostic geners and for evaluating immune responses. Unlike conventional epitopes, immunosuppressive epitopes that may be present in whole antigens can be avoided with the use of the vaccine composition of (I). The ability to combine selected epitopes and further, to modify the composition of the epitopes enhances the immunogenicity. The possible pathological side effects caused by infectious agents or whole protein antigens, which might have their own intrinsic biological activity, are eliminated. AAG89363 to AAG89747 represent amino acid sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Gaps

The present invention describes a polypeptide comprising a portion of a by3 comprising a post-translationally modified amino acid residue where the modification is a phosphorylation, glycosylation or prenylation, and an immunogenicity enhancer. The polypeptide is used to detect anti-p53 autoantibodies in a human patient. The antibody can be used to determine the post-translational modification state of a p53 protein. These are used especially in the diagnosis of cancer. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Assays and screening methods based on direct interaction between FHA domains and phosphopeptides, useful for characterizing binding and to identify binding partners and modulators of FHA domain-phosphopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention relates to assays and screening methods based on a direct interaction between fork head associated (FHA) domains and phosphorylated polypeptides, for characterizing the binding of these molecules. FHA peptides may be useful for treating medical conditions associated with defects in transcriptional control, DNA replication, DNA repair, cell cycle control or other cellular process. The method may provide valuable insights into checkpoint signalling, has important implications for the functions of other FHA domain-containing proteins and provides basis for new lines of therapy. The present sequence is a peptide used in the present invention.
                                                           The present invention relates to assays and screening methods based on a direct interaction between fork head associated (FHA) domains and phosphorylated polypeptides, for characterizing the binding of these molecules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       that targets molecules for ubsquirin dependent processives. (C) have cytostatic, nootropic and antiproliferative activity, Also described is a method for the treatment of a disease or condition where affected is cells have a defective protein, comprising administering (C) to promote degradation of the target protein in cells by ubiquirin dependent proteolysis. (C) can also be used for modulating the proliferation, growth and/or differentiation of cells. (C) can be used to modulating ubsquirin dependent proteolysis or cell proliferation, growth and or differentiation of cells. (C) can be used to modulate ubiquirin of cells. (C) is useful in the treatment of cancers and neurodegenerative disorders as well as spinal degeneration. The present sequence represents a biotinylated peptide which is used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a cdc4 phospho design (CPD) motif, (C),

Identification and MI2-terminal amino acid sequence of three insulin-like growth factor-binding proteins in porcine serum.";
Blochem. Blophys. Res. Commun. 181:1131-1136 (1991).
-! FUNCTION: IGFS-BINDING PROTEINS PROLONG THE HALF-LIFE OF THE IG AND HAVE BEEN SHOWN TO EITHER INHIBIT OR STIMULATE THE GROWTH PROMOTING EFFECTS OF THE IGFS ON CELL CULTURE. THEY ALTER THE INTERACTION OF IGFS WITH THEIR CELL SURFACE RECEPTORS.
-! SUBCELLULAR LOCATION: Secreted.
-! SIMILARITY: CONTAINNS 1 THYROGLOBULIN TYPE-I DOMAIN.
-! SIMILARITY: EBLONGS TO THE INSULIN-LIKE GROWTH FACTOR BINDING

"Morganella morganii urease: purification, characterization, and
isolation of gene sequences.";
J. Bacteriol. 172:3073-3080(1990).
-!- CATALYTIC ACTIVITY: Urea + H(2)0 = CO(2) + 2 NH(3).
-!- COPACTOR: Binds 2 nickel ions per subunit (Potential).
-!- SUBUNIT: (ALPHA, BETA, GAMMA) (3) (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE UREASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bacteria; Proteobacteria; gamma subdivision; Enterobacteriaceae;

"Primary structure of two neuropeptide hormones with adipokinetic and
hypotrahalosemic activity isolated from the corpora cardiaca of horse
flies (Diptera).";
Proc. Natl. Acad. Sci. U.S.A. 86:8161-8164 (1989).
-I-FUNCTION: THIS HORWONE RELEASED FROM CELLS IN THE CORPORA
CARDIACA AFTER THE BEGINNING OF FLIGHT, CAUSES RELEASE OF
DIGTYCERNDES FROM THE FAT BODY AND THEN STIMULATES THE FLIGHT
MUSCLES TO USE THESE DIGLYCERIDES AS AN ENERGY SOURCE.
-I-SIMILARITY: BELONGS TO THE AKH / HRTH / RPCH FAMILY.

                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC COMPATIBLE

COMPATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.25

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/245,500A

FILING DATE: 07-APR-1993

CLASSIFICATION: 435

ATTORNEY/AGENT INFORMATION:

NAME: KAGAN, SARAH A.

REGISTRATION NUMBER: 32,141
